Avoiding Pinch Points

Avoiding Pinch Points

Reaction arm pinch hazard

A pinch point is created on the active front side between the torque wrench reaction arm and the reaction surface. This pinch point is an area where technicians may get their hand caught during normal operations. This can be avoided but only with safety training and constant vigilance.

Backup wrench pinch hazard

A second pinch point is created on the passive rear side of the flange where the backup wrench is braced against a firm surface. This is a potential area where technicians can get their hands caught. This can be avoided but only with safety training and constant vigilance.

Avoiding Pinch Points

Action – Reaction

For every Tool Torque action driving a nut in one direction there is an equal opposition Torque called “Reaction” driving the tool body in the opposite direction.

Equivalent to a Truck

Looking at this from a different angle, this reaction force is just like parking the entire weight of your truck at a single point

Avoiding Pinch Points

Avoiding Pinch Points

Using conventional torque tightening methods, the torque tool must be braced typically with reaction arm and the back nut must be braced with a backup wrench.

Is there a better way?

Given the high concentration of reaction forces involved with conventional torque bolt tightening - and the associated safety hazards and potential damage to equipment...is there a better way?

Positioning the Tool

Not Recommended

Indexing Reaction Arm

Never set the reaction arm to the bulkhead of the pipe. This can cause the tool to slip off of the application, this can also cause stress fractures to the pipe

Positioning the Tool

Not Recommended

Indexing Reaction Arm

Never set the reaction arm at a wedge angle to the bulkhead of the pipe or even the nut. This can cause the tool to slip off of the application while working at these high pressure settings.

Positioning the Tool

Recommended

Indexing the Reaction Arm

It is always good practice to set the reaction arm at a straight even plane with the nut.

Sometimes a longer reaction arm is needed to react off the side of the flange

Positioning the Tool

Recommended

Indexing the Reaction Arm

It is always good practice to set the reaction arm at a straight even plain with the nut.

Positioning the Tool

Socket Safety

Always use impact grade hex sockets sized correctly.

❑ Always Use Premium Impact Grade Sockets

Bolting sockets are heavy duty made for torsion & shock, forged and heat tempered for toughness, have thicker walls, never plated

Avoid light duty chrome plated consumer sockets which are brittle and prone to shatter, these are not designed for power tools

❑ Always Use the Strongest Socket for the Job

Hex sockets have thicker and stronger walls, loads on flats
12-point sockets have thinner walls, loads on points

❑ Always Use the Correct Size and Material Socket

Sloppy or high loading on the socket can shatter the socket

❑ Take Care with Extensions and Adapters

Never use universal joints in torque operations or other adapters that may not be strong enough to transfer the torque.

Socket Safety

- ❑ **Always Pin the Socket to the Drive**
Make sure sockets are firmly attached to the drive,
- ❑ **Avoid Thin-Wall and Deep-Well Sockets**
Never Use a Cut-Down or Modified Socket, the integrity of the metal forging is destroyed
- ❑ **Always Inspect Every Socket Before Use**
Make sure there are no visible cracks, rounding or damage
- ❑ **Never Strike a Socket Under Load**
The socket material can shatter and explode
- ❑ **Keep Clear of the Fracture Danger Zone**
Especially during Final Stage of Tightening, or initial Breakout

Hydraulic Pressure Awareness

- Communicate the Risk of High Pressure Injection**
Train all operators on the potential dangers of high pressure injection.
- Inspect all Components for Damage**
Repair or replace any damaged components.
- Make Sure Components Meet Specification**
Hoses should be marked with proper pressure rating.
- Check-ball fittings and Connectors**
Ensure that hose connectors cannot come apart under pressure.
- Avoid Exposure/Contact with Hydraulic Fluid**
Wear oil resistant gloves & safety glasses to protect skin and eyes from irritation.
- Inspect Tool Seals for Leaks or Damage**
Repair or replace any damaged parts.

Hydraulic Pressure Awareness

Hydraulic Pumps generate up to 10,000 psi of hydraulic pressure, always take caution when handling pumps.

- Keep fan vents clean**

Vents on the AC motor and on the oil cooler fan should be free of debris to prevent overheating/fire.

- Verify power control**

Do not use a pump that cannot be powered on/off; this condition is dangerous and must be repaired.

- Power unit off for configuration changes**

Disconnect the pump from the power supply before making any configuration changes or before storing the tool to reduce the risk of advertently powering on the pump or bolting tools.

- Trained Operators Only**

Do not allow persons unfamiliar with these instructions to operate the Pump or Hydraulic bolting tools.

- Maintain pump components**

Check for breakage of parts and any other condition that may affect the pumps operation. Have damaged parts repaired before use.

Hydraulic Pressure Awareness

**Hazardous
area** >

Explosion Proof and Intrinsically Safe
products for ATEX, UL and IECEx-
approved areas

Hydraulic bolting

Hydraulic bolting can be done where flammable or even explosive gases or liquids could be present.

Air-Powered Pump

An air powered intrinsically safe pump should be used instead of one with an electric motor.

Non-Sparking

The air pump is totally non-sparking and does not pose an ignition risk.

Personal Protective Equipment

Wear hearing protection when working in areas with noise levels exceeding 80dB. 170,000 people in the UK consider they suffer from hearing loss or other ear conditions caused by their work.

EARS

Wear a safety helmet to protect your head from impacts, knocks or abrasions. Never wear metal hard hats when working around or near electricity.

HEAD

Use safety eyewear to protect your eyes when hazardous conditions exist. Areas where there are possible chemical splashes, sparks, and ultraviolet radiation are considered high risk.

EYES

Wear high-visibility clothing to be seen and safe in all conditions. Choose from workcoats and shirts to lightweight jackets, over-coats and trousers.

HIGH-VISIBILITY CLOTHING

Wear protective clothing to protect against chemicals, asbestos, grease and grime. Choose from light-duty aprons and coats, through to jackets and heavy-duty boiler suits.

CLOTHING

Wear hand protection to protect against harmful chemicals and manual handling operations. Different hazards require different glove materials. An estimated 65,000 people suffer with skin disease caused by their work.

HANDS

Wear foot protection to ensure safety in hazardous locations. Protective footwear should be sturdy, including metal toe caps, and have non-slip soles.

FEET

Wear respiratory equipment to protect against dust, fumes, vapours and other harmful elements. It is estimated that 151,000 people are suffering respiratory diseases caused by their work.
